

THE STORY WE CHOOSE

Why Our Narrative Determines Our Future — and How to Change It

Best for	Anyone who wants to understand why inner work matters at the collective level. Start here for the big picture.

Credit and Origin

The core teachings in this document — ‘We are the technology we’ve been waiting for,’ ‘Change your story, change your life; change our story, change the world,’ the concept of a ‘battle for our story,’ and the framing of the human body as ‘soft technology’ — are drawn from Gregg Braden’s work, particularly his book *Human by Design* and his public lectures on technology, consciousness, and evolution.

The epigenetic science is drawn from the research of Bruce H. Lipton, Ph.D., particularly *The Biology of Belief*. The field intention research is drawn from Lynne McTaggart, *The Intention Experiment* and *The Power of Eight*.

The synthesis, secular translation, and integration with the Global Stewardship Framework is the work of Gaynor Kim-Sing.

Executive Summary

There is a silent contest unfolding over the most fundamental thing about us: our story.

Not just the stories we tell in books and films. The deeper story — the one we may not even know we hold — about who we are, where we come from, what we are capable of, and what we deserve. This story operates beneath consciousness. It shapes which problems we try to solve, which relationships we choose, how we treat our own bodies, which policies we accept, and what kind of world we build for those who follow us.

Right now, two stories compete. One says we are random biological machines, limited by our genes, destined to compete, and in need of technological enhancement to overcome our inherent inadequacy. The other — emerging from the convergence of epigenetics, neurocardiology, quantum biology, and consciousness research — says something different: **we are far more than we have been told**.

We are not broken machines waiting for an upgrade. In Gregg Braden’s framing, we are ‘soft technology’ — made of soft circuits, soft antenna, and programmable neurons, wired to sense subtle energy, subtle realms, and subtle life. We are the technology we have been waiting for.

Section 1: The Battle for Our Story

1.1 What Is a ‘Story’ in This Context?

A ‘story,’ as used here, is not fiction. It is the deep, often unconscious narrative we hold about the nature of reality and our place in it — assembled from beliefs and assumptions absorbed from family, culture, education, and media without ever being consciously chosen.

THE OLD STORY	THE NEW STORY
We are random biological machines, the product of accidental mutations and competition	We are <u>intentional</u> beings with capacities far beyond what we have been taught
Our genes control our destiny; we are victims of our heredity	Our environment, perceptions, and beliefs influence gene expression; we are <u>co-creators</u> of our biology
Competition is the driving force of evolution; cooperation is weakness	<u>Connection</u> and <u>cooperation</u> are the most fundamental impulses of life
We need technology to overcome our limitations	We <u>already</u> possess extraordinary capacities that technology can <u>only approximate</u>
We are separate individuals in a dead, mechanical universe	We are <u>interconnected</u> participants in a <u>living, intelligent</u> field

1.2 Why This Matters

“If you change your story, you change your life. Change our story, you change the world.” — Gregg Braden

Everything flows from the story. A civilisation that believes it is made of competitive machines builds competitive, machine-like institutions — extractive economies, adversarial politics, disposable relationships with the natural world. A civilisation that understands itself as interconnected participants in a living system builds institutions of stewardship, cooperation, and reverence for life.

The story is not abstract philosophy.

It is the operating system of civilisation.

Change the operating system, and everything running on it changes.

Section 2: We Are the Technology We Have Been Waiting For

2.1 The ‘Soft Technology’ of the Human Body

The human body is not an outdated biological machine. It is itself the most sophisticated system we know of:

HUMAN CAPACITY	WHAT IT DEMONSTRATES
The heart generates an electromagnetic field detectable several feet away and sends more signals to the brain than it receives	The heart is a <u>primary intelligence</u> organ, not merely a pump
The brain reshapes its own structure based on experience and intention (neuroplasticity)	The mind is not fixed; it is <u>responsive and</u> programmable
Cell membranes respond to environmental signals — including thoughts and beliefs — altering which genes are expressed	Biology is not destiny; it is <u>dialogue</u>
The nervous system acts as a finely tuned antenna, sensing subtle energies and fields	Human <u>perception extends beyond</u> the classical five senses
Groups in coherent emotional states measurably affect physical systems at a distance	Human <u>attention is a force</u> , not a private event

2.2 The Transhumanist Question

A growing movement proposes merging humans with technology — neural implants, genetic engineering, digital consciousness upload — as the next step in evolution. This vision promises to overcome human limitation.

But it rests on a flawed premise: that we are inherently limited and require external enhancement. The emerging science tells a different story. We are not limited. We are under-utilised.

The risk is not that technology will destroy us. The risk is that we will outsource our humanity before we have begun to explore our full potential — and in doing so, lose the very capacities that make us worth preserving.

Section 3: The Science Supporting a New Story

3.1 Epigenetics — Your Beliefs Shape Your Biology

Bruce Lipton’s research demonstrated that the cell membrane — not the nucleus — functions as the primary information-processing organ of the cell. Environmental signals, including perceptions and beliefs, determine which genes are expressed. DNA is not destiny. It is a blueprint that the environment continuously regulates.

Old story: 'My genes control my health. I am a victim of my heredity.' New story: 'My perceptions, beliefs, and environment influence my gene expression. I am a participant in my own biology.'

3.2 Neurocardiology — The Heart Is a Brain

HeartMath Institute research has established that the heart has its own intrinsic nervous system — a 'heart-brain' — that sends more signals to the cranial brain than the reverse. When the heart is in coherence — generated by sustained states of appreciation, care, or gratitude — it synchronises brain function and influences the physiological states of people nearby.

3.3 The Intention Experiments — Attention as a Force

Lynne McTaggart's large-scale Intention Experiments, conducted with thousands of participants worldwide, demonstrated that focused group intention measurably affects physical systems — from seed germination to water crystallisation to human physiological markers. Her Power of Eight research showed that small groups focusing healing intention on a single member produced measurable physical results in both the subject and the participants.

3.4 The Field — We Are Not Separate

Quantum physics and field theory converge on a single insight: there is no empty space. We exist as dynamic patterns within a continuous field of energy and information. Separation is a useful cognitive map, not the underlying reality.

Section 4: Practical Implications

4.1 For Personal Life

If the new story is accurate, then your beliefs about your health actively influence your health outcomes; your inner state shapes your perception and the relational field around you; your inherited patterns are real — and modifiable; and the story you tell about who you are determines the actions available to you.

4.2 For Governance and Policy

Competition-based systems are built on a false premise; cooperation is not idealism but biological reality. Governance must account for interconnectedness — what affects one affects all. AI must be designed to reflect and support human coherence, not to replace human connection. The most cost-effective intervention available is at the level of story — changing what people believe is possible.

4.3 For the Future

The contest for our story is not settled. It is being resolved, moment by moment, in the narratives we tell ourselves and each other, in the policies we enact, in the technologies we build. The old story leads toward extraction, control, and the gradual outsourcing of human

agency to machines. The new story leads toward stewardship, connection, and the conscious development of human potential. Neither outcome is predetermined. Both are choices.

Section 5: The Planetary Boundaries Context

Gregg Braden references the eight parameters that must remain stable for Earth to sustain complex life, drawn from the Stockholm Resilience Centre’s Planetary Boundaries framework:

PLANETARY BOUNDARY	CURRENT STATUS (2026)
Climate Change	Breached
Biodiversity Loss	Breached
Biogeochemical Flows (Nitrogen, Phosphorus)	Breached
Land-System Change	Breached
Novel Entities (Chemical pollution, plastics)	Breached
Freshwater Use	Approaching boundary
Ocean Acidification	Approaching boundary
Atmospheric Aerosol Loading	Insufficiently quantified

The old story treats these as separate, technical crises. The new story recognises them as symptoms of a single underlying condition: a civilisation operating from a narrative of separation, domination, and short-term extraction.

Addressing the root cause — the collective story —
is the highest-leverage intervention available.

Section 6: Connection to the Global Stewardship Framework

FRAMEWORK DOCUMENT	HOW THE STORY WE CHOOSE SUPPORTS IT
1. GSC Charter	The Charter is the structural expression of the new story — stewardship in place of domination, seven-generation thinking in place of short-term cycles
2. Consciousness & Safer AI Design	<u>Coherent</u> humans build coherent AI; we do not need to merge with machines — we need to develop the capacities we already have
3. The Ancestral Dimension	Epigenetics provides the biological mechanism for inherited patterns — and confirms they are <u>not fixed</u> destiny but modifiable dialogue

5. GSC RevCon Full Submission	The nuclear deterrence architecture is itself a product of the old story: competition, separation, and <u>mutually</u> assured destruction as stability
7. Nash Equilibrium Brief	The suboptimal Nash equilibrium of nuclear deterrence is held in place by the old story; the new story makes <u>cooperative solutions thinkable</u>
9. The Mirror Model	<u>Peer support</u> is the practice of the new story — <u>connection</u> over isolation, <u>coherence</u> over reactivity
10. The Narrative Shift	This document provides the philosophical and scientific foundation for The Narrative Shift; it answers the question: why does narrative matter?
11. The Field of Connection	The field itself is the scientific basis of the new story — love and coherence are <u>not</u> metaphors but <u>measurable states</u> with <u>measurable effects</u>
12. The Heart's Compass	The heart is the central organ of the new story — the master navigator , not the servant of the brain
13. The Unified Self	The new story integrates what the old story fragments: the self, the community, the relationship between human and natural systems

Section 7: A Daily Practice

At the start of each day, take one minute:

- **Ask:** “What story am I living from today? The old story of limitation, separation, and fear? Or the new story of connection, capacity, and care?”
- **Choose:** “I choose the new story. I am not a broken machine. I am soft technology — wired for connection, capable of coherence, part of a living field.”
- **Act:** Take one action today that reflects the new story. One act of genuine connection. One moment of full presence. One choice made from care, not fear.

“We are the technology we’ve been waiting for.

Change your story, change your life. Change our story, change the world.”

— Adapted from Gregg Braden

The tools are free. The science is clear. The story is yours to choose.
