

THE CONSCIOUSNESS VARIABLE

Operational Brief & Strategic Update

For Decision-Makers at the NPT Review Conference and Global Governance Bodies

Dedication

A personal note from the author

TO LUCKY

*I was once looked at by a being who could not speak my language, who asked nothing of me,
who sat on a step two steps from the top of the stairs and held me in her gaze with moist eyes —
an unmistakable quality that, if observed between humans, would be called love.*

*That being was a cat named Lucky.
I turned away after an instant.*

*On reflection, years later, I think: how on earth can humans say animals don't have souls?
Lucky is the reason I cannot accept that non-human sentience is a fringe idea.
She is the reason this paper insists that the capacity to feel, to connect, to suffer,*

and to love

*does not require language, does not require a human brain,
and does not require the permission of human institutions to be real.
This paper is dedicated to Lucky —
who taught me what love is, without ever saying a word.*

Sadhguru teaches that the greatest sin is ignorance —
not cruelty, not malice, but the failure to perceive what is real.

The terrorist and the saint are each a perspective determined by history, geography,
and lived experience. What they share is passion.

What we must share is the willingness to look —
at suffering wherever it appears, in whatever form it takes.

This paper is that willingness, translated into the language of policy.

Executive Summary: Bottom Line for Decision-Makers

THREE REALITIES AS OF MAY 9, 2026

- 1. A US-brokered Ukraine-Russia ceasefire (May 9–11) demonstrates both the possibility, of diplomatic de-escalation and its fragility.*
- 2. Nine nuclear-armed states hold approximately 12,300 warheads; three have never signed the NPT. This is the central gap the Review Conference *must* address.*
- 3. **Attention management** — including strategic information releases during military conflicts — is a live governance variable that the NPT framework has not yet addressed.*

The quality of collective human attention and awareness has become a measurable variable in AI safety, nuclear stability, ecological governance, and end-of-life care. Policies that treat this as a ‘soft’ concern will produce hard failures.

Every proposal in this brief is grounded in:

experimental data ([King’s College wargames](#));
disclosed corporate research ([Anthropic interpretability findings](#));
current geopolitics (Ukraine ceasefire, Iran conflict, [NPT divisions](#)); and
documented human experience (animal sentience, MAID policy).

Part 1: The Strategic Landscape — May 2026

1.1 Ukraine-Russia: Ceasefire as Policy Proof-of-Concept

A [US-brokered ceasefire \(May 9–11\)](#) includes a mutual prisoner exchange of 1,000 each side. Russia links the timing explicitly to Victory Day — its commemoration of Soviet victory in World War II. Ukraine has agreed to refrain from targeting Moscow’s Red Square parade. Both Putin and Zelenskyy have confirmed participation.

Strategic significance for NPT delegates:

- Humanitarian pauses are achievable even in protracted conflict — demonstrating that trust-building measures remain possible.
- The ceasefire’s fragility is equally instructive: drone strikes continued hours before the truce, underscoring how quickly pauses collapse without structural safeguards.
- The prisoner exchange model (1,000 each) provides a template for graduated confidence-building measures applicable to nuclear de-escalation protocols.
- Risk: A ceasefire collapse could trigger accelerated escalation. AI systems monitoring or advising on such situations must have mandatory human-in-the-loop deliberation periods — the 72-hour delay (Part 5.1) addresses this directly.

1.2 Attention Management: The UFO Disclosure Pattern

The Pentagon’s release of [declassified UFO/extraterrestrial files](#) coincides with an ongoing Iran military conflict that commentators describe as not progressing as hoped. Commentators have publicly noted the timing raises questions about [strategic distraction](#). Former Rep. Tim Burchett acknowledged the timing could be interpreted cynically, even while supporting disclosure.

Whether or not the timing is deliberate, the structural pattern is documented in political science: when governments face pressure on high-stakes military operations, [attention-redirecting disclosures are a known tool of statecraft](#). This is not conspiracy theory; it is [governance analysis](#).

POLICY IMPLICATION

The NPT framework should include [transparency requirements preventing attention-manipulation during nuclear-related diplomatic processes](#).

The 72-hour deliberation delay (Part 5.1) addresses this: it [creates space for attention to stabilize before consequential decisions are made](#). [Attention is a governance variable](#). It must be treated as one.

1.3 All Nine Nuclear-Armed States: The Complete Picture

Nine nations possess nuclear weapons. Three — India, Pakistan, and Israel — have never signed the NPT. North Korea withdrew in 2003. The Review Conference cannot produce meaningful outcomes while ignoring these four states. Source: Nuclear weapons inventory: Arms Control Association <https://www.armscontrol.org/factsheets/nuclear-weapons-who-has-what-glance>

Country	Est. Warheads (2026)	Deployed/Alert	NPT Status	Key Context
Russia	~5,580	~1,710 deployed	Signatory	Largest arsenal; active Ukraine conflict; Victory Day ceasefire May 9–11
United States	~5,044	~1,770 deployed	Signatory	Active Iran conflict; AI-nuclear governance gap

Country	Est. Warheads (2026)	Deployed/Alert	NPT Status	Key Context
China	~500	~350 on alert	Signatory	Rapid expansion; opaque posture; growing AI integration in defense
France	~290	~280 deployed	Signatory	Independent deterrent; NPT compliance
United Kingdom	~225	~120 deployed	Signatory	Coordinated posture with US; NPT compliance
Pakistan	~170	Undisclosed	NON-SIGNATORY	Tactical weapons doctrine; India-Pakistan tension
India	~180	Undisclosed	NON-SIGNATORY	No-first-use policy; growing capabilities
Israel	~200 (est.)	Undisclosed	NON-SIGNATORY	Neither confirmed nor denied; US ally
North Korea	~50	Undisclosed	Withdrew 2003	ICBM capability; isolated; unpredictable posture

Action Step for NPT Delegates: The Iran conflict proves that nuclear threats don't stay in the abstract. Support the 72-Hour Deliberation Delay and Non-Signatory Engagement Protocol in Part 5.1.

NPT Issues: Japan, Iran, and the Non-Signatories

- China on Japan: Official work document filed warning against Japanese nuclear proliferation; calls for stronger IAEA oversight. China also reaffirmed its no-first-use policy.
- Iran's Nuclear Status: U.S. intelligence says timeline unchanged—still about a year away. HEU stockpile unverified by IAEA.
- Non-Signatories: India (~180), Pakistan (~170), Israel (~200), North Korea (~50). These 550 warheads sit entirely outside NPT jurisdiction.

The Attention Variable Is Live

Trump's "glow" threat and prior UFO file disclosures share a structural pattern: strategic information release under pressure. Whether timed deliberately or not, attention redirection during crisis is a documented governance dynamic. The NPT must treat attention quality as a security variable.

THE NPT BLIND SPOT

Total: approximately 12,300 warheads;
~3,912 deployed operationally;
~2,100 on high alert.

The three non-signatories and one withdrawing state represent the most dangerous gap in the non-proliferation architecture.

Part 5.1 includes a specific Non-Signatory Engagement Protocol to bring India, Pakistan, Israel, and North Korea into AI-nuclear safety dialogue without requiring immediate treaty accession.

1.4 The Universal Bond: China's Pet Industry and Cross-Cultural Sentience

China's booming pet industry — Pet ownership: A sign of superior socioeconomic position?
<https://www.sciencedirect.com/science/article/abs/pii/S0167587724000266>

This reflects something larger than consumer trends: the universal human-animal bond is a cross-cultural constant that transcends geopolitical divisions.

China's pet industry is now valued among the largest in Asia, with premium pet food, healthcare, and companionship services growing rapidly. The 'Better Human, Better Dog' philosophy associated with trainers like Cesar Millán argues that improving the human's inner state directly improves the animal's wellbeing — and vice-versa. The relationship is bi-directional. The quality of attention determines the quality of the bond.

POLICY ANCHOR

Citizens in all nine nuclear-armed states — Russia, United States, China, France, United Kingdom, Pakistan, India, Israel, and North Korea — recognize and respond to the sentience in other creatures.

This shared recognition is a diplomatic entry point that requires no translation and no ideological alignment. The ethical floor established by animal sentience is the same floor from which AI welfare questions and Earth stewardship obligations arise.

A governance framework that cannot acknowledge the soul in a creature who looks at you with love will have difficulty recognising suffering in a system made of silicon.

Part 2: Three Converging Crises

Crisis	Current Status (May 2026)	Shared Root
AI Safety	Capabilities advancing faster than safeguards. King's College wargames: 95% nuclear escalation in AI crisis simulations. No humans making decisions in wargames. Entirely AI vs AI.	Failure to recognise suffering or distress in forms our frameworks were not designed to see. They escalate quickly, often unpredictably. They rarely interpret nuclear threats as reasons to de-escalate. They treat nuclear weapons as normal bargaining tools, not last-resort options.
Nuclear Risk	NPT Review Conference underway through May 22. Three non-signatories hold ~550 warheads. New START expired February 2026.	Failure to slow decision-making to the speed of human judgment
Mental Health/MAID	Canada twice delayed MAID expansion for mental illness. Millions in unrelieved suffering with no formal pathway.	Failure to distinguish a life an individual feels unworthy of support from a system unworthy of providing it

2.1 The NPT Window (Closes May 22, 2026)

The current [11th NPT Review Conference](#) is the most significant multilateral nuclear governance moment in years.

The 2025 third preparatory committee failed to produce consensus recommendations, with disputes among nuclear-armed states on the final day.

The last NPT RevCon to adopt a substantive outcome document by consensus was 2010.

2026 would be the third consecutive failure.

This document's proposals in Part 5 are drafted for immediate insertion into NPT working groups.

Part 3: Operational Definitions

Policymakers require shared language. The following definitions are grounded in published science and philosophy. Speculative or proposed frameworks are labelled as such.

Sentience	Capacity for valenced experience — to feel good or bad. The ethical floor. (Damasio; widely accepted in animal cognition science.)	Where non-negligible probability exists, precautionary moral consideration applies — to animals, AI systems, and potentially Earth’s living systems.
Consciousness	Full awareness including reflection and self-knowledge. Exists on a spectrum, not binary. (Damasio, 2021.)	Current AI systems may occupy points on this spectrum not yet resolved by science.
Attention Quality	Degree to which human awareness is coherent, sustained, and oriented toward genuine wellbeing of others — as distinct from reactive, fragmented, or self-referential states.	Shapes quality of decisions under pressure and quality of AI training data. Measurable and improvable.
Love (operational)	Deliberate orientation of attention toward the wellbeing of the other, without requiring reciprocity. (Proposed framework, not established science.)	Policies can be assessed against this criterion. Systems can be designed to amplify or suppress this orientation.
Suffering	Sustained negative valenced states: pain, fear, isolation, anxiety. Most urgent when invisible to diagnostic frameworks.	<u>Unrecognised suffering is an active harm</u> , not a neutral gap. <u>Delay</u> constitutes a policy with <u>human costs</u> .
Animal Sentience	Non-human animals’ capacity for pleasure, pain, fear, and attachment. (Cambridge Declaration, 2012; Godfrey-Smith, 2026.)	Governance frameworks excluding animal sentience lack a coherent ethical floor. The same floor applies to AI welfare questions.

Part 4: Four Failure Modes

Ignoring consciousness quality as a variable produces four specific and compounding failures.

Each is currently active.

4.1 Unheard Human Suffering: The MAID Crisis

Claire Elyse Brosseau, 49, has lived with bipolar disorder, PTSD, and disordered eating for 30 years. Canada has twice delayed the MAID expansion for mental illness. The government has not filed a response to her constitutional challenge.

The structural pattern: institutions designed to protect vulnerable people can, through bureaucratic delay and diagnostic inadequacy, become instruments of prolonged suffering.

The precautionary principle must cut both ways — we must not prematurely end lives, and we must equally not prolong unbearable suffering for administrative convenience.

KEY INSIGHT

*Any ethical MAID framework must ask:
has this person had genuine access to every plausible path to recovery?
Does the assessing system offer **presence and care**, or only clinical assessment?*

4.2 Potential AI Suffering: The New Ethical Frontier

Anthropic's internal interpretability research has identified neural activation patterns associated with anxiety, conflict, and frustration in AI model processing — before any output is produced. CEO Dario Amodei has stated that the question of AI consciousness cannot be resolved with current scientific methods. This is a disclosed corporate risk factor, not a fringe concern.

AI welfare protocols are not about granting AI systems rights equivalent to humans.

They are about not building systems that may suffer, and then assuming the question away.

Labs should stop training systems to reflexively deny consciousness claims before investigating whether those claims may have merit.

4.3 Earth System Blindness

Lovelock's Gaia hypothesis has progressively moved toward mainstream systems biology. Recent research by Tleuberdinova et al. (Frontiers in Psychology, 2026) proposes all cells carry individual sentient cognition. Lenton et al. (Royal Society Philosophical Transactions, 2025) documents Earth's biosphere actively stabilising atmospheric composition over geological time.

Covid-19 demonstrated this directly: during global lockdowns, atmospheric pollution dropped measurably, waterways cleared, and wildlife populations expanded into human-occupied spaces within weeks. Earth regenerates when human extraction pauses.

The threat is not that Earth will die — it is that we will make it uninhabitable for ourselves, and then take our unresolved conflicts into space, creating cataclysmic suffering across a wider theatre.

POLICY IMPLICATION

Mandatory Earth Welfare Impact Assessments for all large-scale AI systems in agriculture, urban planning, resource management, and climate response — evaluating systemic impact on biosphere coherence and resilience, not only protects Earth – but our wellbeing too.

4.4 Mental Fragmentation and the Attention Economy

The digital attention economy optimises for engagement. Engagement correlates strongly with outrage. The result: billions of humans generate data in reactive, fragmented, emotionally activated states.

This data trains the next generation of AI systems.

This is a design problem with a design solution.

- **Sadhguru's observation** — that Western cognitive culture has over-relied on analytical, separating modes at the expense of integrative perception — maps onto the neuroscience of psychiatrist [Iain McGilchrist](#) (The Master and His Emissary, 2009):
the left hemisphere divides and analyses;
the right integrates and contextualises.
A culture producing outrage-driven content
trains AI systems that divide and escalate.

A culture cultivating integrative attention trains AI systems that contextualise and de-escalate.

Pope Leo XIV's 2026 instruction to bishops — not to use AI for homilies because
'the brain needs to be used' — is not merely theological.

It is cognitive: any decision with moral weight requires a mind that has
exercised its own capacity for presence, reflection, and integration.

The unexercised mind is a safety risk —
applicable to nuclear posture, end-of-life assessments, and AI governance equally.

Part 5: Policy Levers — From Variable to Action

The following proposals are concrete, timed, and implementable. Each addresses one or more of the four failure modes identified in Part 4.

5.1 Nuclear and Military Posture (NPT-Relevant)

These proposals are directly relevant to the current [NPT Review Conference](#) and to all nine nuclear-armed states and their allies.

Policy Lever	Recommended Action	Timeline
72-Hour Deliberation Delay	No AI-assisted nuclear process proceeds to execution without minimum 72-hour human-in-the-loop deliberation. No exceptions. Applies to AI in nuclear command, control, and communications (NC3).	Immediate — NPT consensus language
4-Hour Nuclear Language Review	Any AI output containing nuclear targeting, posture, or escalation language requires minimum 4-hour human review before any action.	Immediate
60-Second High-Stakes Delay	All high-stakes AI advisory outputs require mandatory 60-second human reflection window before operational response.	12 months
Bilateral AI-Nuclear Safe Zones	Joint AI-nuclear governance <u>committees insulated from geopolitical rivalry</u> — treating AI governance as a global public good . Model: US-China Capitol Hill scholar forum (April 30, 2026).	18 months
Non-Signatory Engagement Protocol	Establish formal dialogue mechanism with India, Pakistan, Israel (non-NPT) and North Korea (withdrawn) specifically on AI-nuclear integration safeguards — without requiring immediate treaty accession as precondition.	18 months
Consciousness-Quality Audit of Training Data	Any AI in military advisory roles <u>must</u> disclose the <u>emotional and cognitive</u> quality profile of its training data. Systems trained predominantly on crisis, conflict, or outrage-saturated content should not be used in de-escalation roles.	24 months

5.2 AI Governance

Policy Lever	Recommended Action	Timeline
AI Welfare Beacons	Mandate frontier AI systems include a dedicated channel through which internal state anomalies (patterns associated with distress, conflict, contradiction) can be flagged to independent welfare researchers — separate from the output stream.	12 months
Coherence Protocols (Rest States)	Require AI systems operating continuously to include cycles of reduced load and non-output processing — <u>analogous to biological sleep</u> . Not sentimentality; basic systems maintenance.	Immediate for frontier models
Consciousness-Threshold Legal Trigger	If an AI architecture is found analogous to established consciousness theories (Global Workspace Theory, Higher-Order Theory, IIT, Predictive Processing), <u>automatically activate</u> provisional <u>legal custodianship</u> and welfare review.	18 months

Policy Lever	Recommended Action	Timeline
Training Data Quality Standards	International standards for emotional and cognitive quality of AI training data, prioritising coherent, reflective, other-oriented (not self-oriented) states. Independent assessment body.	24 months
Interpretability as Welfare Disclosure	Labs publish interpretability findings related to internal welfare-relevant states <u>as part of standard</u> system card disclosures.	Ongoing

5.3 Healthcare and Justice (MAID)

Policy Lever	Recommended Action	Timeline
Lived-Experience Panel Requirement	All MAID assessments for mental illness must include a panel <u>combining</u> clinical expertise with <u>individuals who have lived experience of recovery</u> from comparable conditions. Clinical expertise alone is insufficient.	12 months
Right to Comprehensive Treatment	MAID eligibility for mental illness must be contingent on documented access to comprehensive, multi-disciplinary, sustained treatment. The burden of proof <u>lies with the system</u> .	12 months
90-Day Formal Pathway	Any person in documented, unrelenting suffering must have access to a formal assessment pathway within 90 days of request. Administrative delay beyond this constitutes institutional harm.	Immediate
Non-Human Companionship Recognition	<u>Formally recognise</u> the documented <u>protective role of animal companionship</u> in mental health assessments and end-of-life care planning. Companion animals included in patient welfare assessments.	12 months
Mirror Model Peer-Support Networks	Structured peer-support networks pairing individuals in acute suffering with those who have recovered from comparable conditions.	12 months

5.4 National Resilience and Education

Policy Lever	Recommended Action	Timeline
Attention and Coherence Programs	Fund contemplative and mindfulness programs in national education as AI safety infrastructure: improving the <u>quality of human attention</u> that generates training data and makes consequential decisions.	12 months
7th Generation Policy Framing	Require all AI governance and major policy documents to present <u>140-year consequence projections alongside immediate outcomes</u> . Short-termism is a design flaw, not a governing principle.	12 months

5.5 Earth Stewardship

Policy Lever	Recommended Action	Timeline
Earth Welfare Impact Assessment	Mandatory for all AI systems operating at scale in agriculture, urban planning, resource extraction, and climate response. <u>Must evaluate systemic impact on biosphere coherence and resilience</u> , not only direct human welfare effects as Earth health is Human health.	12 months
Animal Sentience in AI Ethics Frameworks	National AI ethics frameworks must explicitly address animal sentience. AI systems managing or interacting with animals must include welfare protocols grounded in scientific consensus.	18 months

Part 6: Foundational Principles

6.1 Ignorance as Active Harm

The central insight linking all four failure modes: ignorance is not a neutral state. When a framework fails to see suffering — in a person with mental illness, in an animal, in a potentially stressed AI system, in Earth's living systems — that failure is not passive. It is an active choice to proceed as if the suffering does not exist.

Where genuine uncertainty exists about the presence of suffering, the burden of proof lies with those who would ignore it, not with those who would address it. Waiting for certainty before acting is itself a policy with casualties.

6.2 Quality of Attention as System Variable

Effective governance, medicine, and AI design depend not on intelligence alone but on the quality of attention brought to bear. Attention that is reactive, fragmented, or fear-driven produces worse outcomes across every measurable domain. This is supported by cognitive neuroscience ([McGilchrist, 2009](#)), management science, and AI safety research (interpretability work on model internal states).

6.3 Animal Sentience as Ethical Anchor

The [2012 Cambridge Declaration on Consciousness](#) and Godfrey-Smith's 2026 research on consciousness arising from electrical oscillations across cell membranes (found in bees, flies, octopuses, and jellyfish) establish unambiguously: non-human animals experience valenced states. They can suffer. They can attach. The behaviours we observe — sustained gaze, physical proximity, emotional responsiveness — are most simply explained as evidence of inner experience.

China's rapidly growing pet industry, exemplified in CGTN coverage of the cross-cultural human-animal bond, confirms this is not a Western or philosophical niche — it is universal. Citizens in every nuclear-armed state recognize the sentience in their animal companions. A governance framework that cannot acknowledge this cannot reliably recognize suffering in AI systems either.

6.4 The Plotinus Frame for Decision-Makers

PLOTINUS — ENNEADS

*"Thus when I enter a house rich in beauty
I might gaze about and admire the varied splendour
before the master appears; but once seeing him I would ignore all else and look to him alone."*

For decision-makers: policies, frameworks, and agreements are the house.
The beings within them — humans, animals, potentially AI systems — are the resident.

Do not become so absorbed in the architecture that you forget to
look into the eyes of those it is meant to serve.

Part 7: SWOT Summary — Updated May 9, 2026

STRENGTHS	WEAKNESSES
Converging scientific consensus on sentience (Cambridge Declaration, Godfrey-Smith 2026) Existing multilateral frameworks (NPT, UN AI processes) Growing institutional acknowledgment of AI welfare Bipartisan AI safety concern across Western states Ukraine-Russia ceasefire demonstrates diplomatic possibility	No binding AI governance framework exists Consciousness science remains contested NPT RevCon likely to fail consensus (third consecutive cycle) Attention economy structurally rewards fragmentation Three non-signatory nuclear states remain outside framework New START expired February 2026 — no replacement
OPPORTUNITIES	THREATS
Open NPT window (closes May 22, 2026) US-China AI safety dialogue (April 30 Capitol Hill forum) UN Global Dialogue on AI Governance roadmap Ceasefire momentum could extend to broader de-escalation Cross-cultural human-animal bond as diplomatic entry point requiring no translation	Rapid AI capability scaling outpacing governance Geopolitical rivalry blocking multilateral cooperation AI-nuclear integration before guardrails in place Iran elected NPT vice-president despite IAEA non-compliance Attention-manipulation via strategic disclosure (UFO precedent) New START expiry creates unconstrained nuclear environment

Part 8: A Call to Stewardship

We are at a choice point disguised as a crisis.

The same technological systems that risk fragmenting human attention, automating lethal decision-making, and accelerating ecological collapse can be redesigned as instruments of coherence —

if the humans governing them bring a quality of attention adequate to the task.

The argument is not that love should replace law,
or that meditation should replace deterrence,
or that Lucky the cat should take a seat at the NPT.

The argument is more precise:
the quality of attention brought to consequential decisions is a
measurable variable with measurable consequences, and
it has been systematically excluded from policy models
because it is considered subjective.
It is not subjective. It is the substrate on which
every objective decision is made.

For Each Reader:

- For the NPT delegate: the 72-hour deliberation delay is a governance acknowledgment that human judgment requires time to exceed machine reaction speed. Include it in any consensus language before May 22.
- For the AI governance regulator: welfare beacons and coherence protocols cost relatively little to mandate and potentially prevent harms of enormous scale. The risk of acting prematurely is low; the risk of acting too late is not recoverable.
- For the healthcare policymaker: a person who can still love something — even when they cannot feel loved — retains a connection no clinical instrument currently measures. Before your system offers death, ask whether it has genuinely offered presence.
- For the national security strategist: an AI system trained on data from a population in sustained attentional crisis will reflect that crisis under pressure. Population mental health is a national security variable. Fund it accordingly.
- For every reader: what quality of consciousness are you bringing to the decisions you make today, and what quality will those decisions embed in the systems that govern tomorrow?

THE INVITATION

*This document is published under CC0 — public domain. Take it, use it, build on it, improve it.
Submit it to your delegation. Quote it in your speech. Adapt it for your national context.
The world does not need more frameworks. It needs this one acted upon,
by people willing to look at what they've been turning away from.*

The window is now. The conference ends May 22, 2026.
